## 01 PROBLEM STATEMENT

- Fashion returns are structurally high, and **size/fit and product-information gaps** are a major, preventable source. Public benchmarks: 53% of surveyed US apparel sellers name size/fit the top return reason (Coresight, 2023); ~70% of apparel returns trace to poor fit or style (McKinsey survey).
- Causes are largely informational: size picked from habit or brand label, inconsistent brand sizing, and missing or inaccurate garment measurements.
- This product helps customers decide **before ordering** by showing accurate product measurements and personalized size guidance.
- We are not trying to eliminate all returns.** We target avoidable returns caused by information gaps; try-and-return and the return policy stay as they are.

*“Returns are not the problem by themselves. The problem is the preventable mismatch between what customers expect and what they receive.”*

## 03 TARGET USERS

| SEGMENT                          | WHO                              | WHAT THE PRODUCT DOES FOR THEM                                                                   |
|----------------------------------|----------------------------------|--------------------------------------------------------------------------------------------------|
| A. Existing customers            | Have purchase / return history   | Size recommendation personalized from previously kept and returned sizes, by brand and category. |
| B. New customers                 | No useful fit history            | Cold-start fallback: verified garment measurements plus brand/category rules.                    |
| C. Privacy-conscious             | Will not share body measurements | Full core experience with zero personal input; any measurement entry is optional and reversible. |
| Secondary: brand / catalog teams | Own listings and size charts     | Flags and scorecards that show which products carry inaccurate or incomplete measurements.       |

## 04 JOB TO BE DONE & USER STORIES

*“When I am buying fashion online, I want to know which size is most likely to fit me using trustworthy product information and my previous preferences, so that I can purchase confidently without needing to return the item.”*

| ID   | USER STORY                                                                                                                     | DONE WHEN (TESTABLE)                                                                                    | FR     |
|------|--------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|--------|
| US-1 | As an <b>existing customer</b> , I want a recommended size based on sizes I kept before, so I order the right size first time. | A returning customer with sufficient relevant history sees one recommended size on eligible products.   | 02, 04 |
| US-2 | As a <b>new customer</b> , I want verified garment measurements per size, so I can choose without history.                     | Measurements for every available size are visible; guidance works with no purchase history.             | 01, 05 |
| US-3 | As a <b>shopper</b> , I want to know how sure the recommendation is and why, so I can decide whether to trust it.              | Every recommendation shows High / Medium / Low plus a one-line reason.                                  | 03, 09 |
| US-4 | As a <b>privacy-conscious customer</b> , I want to use the feature without giving body data and control what is used.          | Core flow completes with zero personal input; data use is explained and optional inputs are reversible. | 06, 10 |
| US-5 | As a <b>customer returning an item</b> , I want to pick the specific fit reason, so the issue is recorded accurately.          | Size/fit returns capture a structured reason (e.g. too small, too large, length).                       | 07     |
| US-6 | As a <b>catalog / brand manager</b> , I want to see products with unusual fit-return patterns, so I can correct listings.      | A review queue lists flagged products with the reason for the flag.                                     | 08     |

## 05 MVP SCOPE — FIVE COMPONENTS

| # | COMPONENT                        | MVP BEHAVIOUR                                                                                                      | WHY IT EXISTS                                          |
|---|----------------------------------|--------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------|
| 1 | Verified Product Measurements    | Garment-level measurements per size; audited for priority categories / brands; displayed clearly.                  | Replaces label-based sizing with checked data.         |
| 2 | Customer Fit Profile             | Derived mainly from past kept / returned sizes, by brand and category. Body measurements optional.                 | Personal signal without asking for personal data.      |
| 3 | Personalized Size Recommendation | Recommends the most suitable size. MVP uses rules and brand/category offsets; ML only after data quality improves. | Targets the ‘wrong size selected’ cause directly.      |
| 4 | Fit-Confidence Indicator         | High / Medium / Low badge beside the size selector with a plain-language explanation.                              | Makes uncertainty visible; protects trust.             |
| 5 | Brand Feedback Loop              | Structured return reasons; flags inaccurate product information; sends corrections to catalog / brands.            | Every return improves the data the next one relies on. |

## 06 EXPLICITLY OUT OF SCOPE FOR MVP

- ✗ Virtual try-on
- ✗ AR-based fitting
- ✗ Mandatory body measurements
- ✗ Rebuilding the return / refund system
- ✗ Changing return policy
- ✗ Warehouse verification
- ✗ RTO optimization
- ✗ Full seller quality-management platform
- ✗ Complex ML before sufficient clean data
- ✗ Blocking customers from returning products

*These may be evaluated in future phases after the MVP establishes data quality and product impact.*

## 07 PRODUCT CONCEPT

|              |                                   |
|--------------|-----------------------------------|
| DATA         | Verified measurements             |
| INTELLIGENCE | Fit profile + size recommendation |
| EXPERIENCE   | Fit-confidence indicator          |
| LEARNING     | Brand feedback loop               |

Principles: data quality before ML · personal data optional · explain every recommendation · fall back to measurements when unsure.

08 USER FLOW

Teal decision support · Orange outcome · Pink learning. Step 10 feeds back into steps 2 and 4.

09 FUNCTIONAL REQUIREMENTS

| ID    | REQUIREMENT                                                                                           | PRI | ACCEPTANCE CRITERIA                                                                        |
|-------|-------------------------------------------------------------------------------------------------------|-----|--------------------------------------------------------------------------------------------|
| FR-01 | <b>Verified measurements.</b> Display verified garment measurements for supported products and sizes. | P0  | For eligible SKUs, customers can view measurements for each available size.                |
| FR-02 | <b>Size recommendation.</b> Recommend a size from customer fit signals and verified measurements.     | P0  | Eligible customers receive one recommended size before purchase.                           |
| FR-03 | <b>Fit confidence.</b> Show recommendation confidence.                                                | P0  | Recommendation displays High / Medium / Low with a short explanation.                      |
| FR-04 | <b>Customer history.</b> Use relevant previous kept / returned size history where available.          | P0  | History is used only when sufficient relevant data exists.                                 |
| FR-05 | <b>Cold-start fallback.</b> Give useful guidance to customers without purchase history.               | P0  | Falls back to verified product measurements and brand/category rules.                      |
| FR-06 | <b>Optional body measurements.</b> Allow customers to voluntarily provide body measurements.          | P1  | No customer is required to provide body measurements to use the core experience.           |
| FR-07 | <b>Structured return reason.</b> Capture structured size/fit return reasons.                          | P0  | Customers can select specific reasons: too small, too large, length issue, fit issue, etc. |
| FR-08 | <b>Product data feedback.</b> Flag products with unusual size/fit return patterns.                    | P1  | Catalog / brand teams can view products requiring measurement or listing review.           |
| FR-09 | <b>Explainability.</b> Every recommendation gives a simple reason.                                    | P1  | e.g. "Recommended M based on your previous kept size and this product's measurements."     |
| FR-10 | <b>Privacy controls.</b> Clearly communicate what customer data is used.                              | P0  | Customer can understand and control optional measurement inputs.                           |

10 NON-FUNCTIONAL REQUIREMENTS

|                |                                                                               |
|----------------|-------------------------------------------------------------------------------|
| Performance    | Recommendation loads without materially increasing product-page latency.      |
| Privacy        | Body measurements are optional and handled as sensitive personal data.        |
| Reliability    | If recommendation data is unavailable, product measurements remain available. |
| Explainability | Every recommendation has a human-readable reason.                             |
| Scalability    | Architecture supports expansion across categories and brands.                 |

11 SUCCESS METRICS

|            |                                                              |                             |
|------------|--------------------------------------------------------------|-----------------------------|
| NORTH STAR | Avoidable Return Rate (avoidable returns ÷ delivered orders) |                             |
| SUPPORTING | • Size/fit return rate                                       | • Product info accuracy     |
|            | • Recommendation adoption                                    | • Conversion                |
| GUARDRAILS | • Recommendation success rate                                | • CSAT                      |
|            | • Product info coverage                                      | • Repeat purchase           |
| GUARDRAILS | • Conversion                                                 | • Privacy complaints        |
|            | • Revenue / order                                            | • Wrong-recommendation rate |
| GUARDRAILS | • Contribution / order                                       |                             |

Do not optimize return rate in isolation. A lower rate is not a win if conversion falls materially, satisfaction falls, contribution decreases, or customers lose trust.

12 MVP LAUNCH CRITERIA

Proceed to broader rollout **only if**:

- Measurement coverage reaches the agreed threshold for target categories.
- Measurement accuracy passes audit.
- Recommendation experience does not materially hurt conversion.
- Size/fit return rate shows statistically meaningful improvement.
- Guardrail metrics stay within agreed limits.
- No major privacy or trust issues emerge.

Thresholds to be finalized with Product, Data Science, Engineering, Design and Finance before experimentation.

13 ROLLOUT PLAN — 12 WEEKS

| PHASE                                                                             | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 |
|-----------------------------------------------------------------------------------|---|---|---|---|---|---|---|---|---|----|----|----|
| <b>Wk 1–2 Diagnose</b><br>Instrument return reasons; baseline                     |   |   |   |   |   |   |   |   |   |    |    |    |
| <b>Wk 3–5 Product data</b><br>Verify priority measurements; standardize size info |   |   |   |   |   |   |   |   |   |    |    |    |
| <b>Wk 5–8 Recommendation MVP</b><br>Rules-based recommendation + fit confidence   |   |   |   |   |   |   |   |   |   |    |    |    |
| <b>Wk 8–10 Feedback loop</b><br>Structured reasons; brand scorecards; corrections |   |   |   |   |   |   |   |   |   |    |    |    |
| <b>Wk 10–12 A/B experiment</b><br>Randomized test; read guardrails; go / no-go    |   |   |   |   |   |   |   |   |   |    |    |    |

14 DEPENDENCIES

|                      |                                          |
|----------------------|------------------------------------------|
| Product              | Scope, priorities, experiment ownership  |
| Engineering          | Page integration; return-reason capture  |
| Data Science / ML    | Recommendation logic; future ML          |
| Design               | Size selector, badge, privacy controls   |
| Catalog / Content    | Verified product measurements            |
| Brand / Seller teams | Measurement validation and corrections   |
| Customer Support     | Fit queries; surface trust issues        |
| Analytics            | Experiment design and metric measurement |
| Finance              | Contribution economics                   |

15 RISKS & MITIGATIONS

| RISK                               | MITIGATION                                                            |
|------------------------------------|-----------------------------------------------------------------------|
| Incorrect product measurements     | Audit and verification before recommendation.                         |
| Wrong recommendation reduces trust | Confidence indicator, explainability, fallback to measurements.       |
| Cold start                         | Rules and product measurements before ML.                             |
| Privacy concerns                   | Body measurements optional; explicit consent.                         |
| Seller resistance                  | Start with high-volume / high-return SKUs; give brand-level feedback. |

PM RECOMMENDATION

“Build the data foundation first, then personalization.”

|                                                                                             |                                                                                   |                                                                                   |                                                                       |
|---------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------|
| <b>PHASE 1 Data foundation</b><br>Verified product measurements + structured return reasons | <b>PHASE 2 Recommendation</b><br>Rules-based size recommendation + fit confidence | <b>PHASE 3 Personalization</b><br>ML personalization once clean data is available | <b>FUTURE Advanced</b><br>Virtual try-on and other advanced solutions |
|---------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------|

ML earns its place only after product data is trustworthy.
